## ERP/CRM Integrator Release Notes

Revision: 18 Jul 2023

You can find the most up-to-date technical documentation on our documentation site at

[https://productresources.collibra.com/docs/erp-crm-integrator/latest/Content/ReleaseNotes/to\\_release-notes.htm](https://productresources.collibra.com/docs/erp-crm-integrator/latest/Content/ReleaseNotes/to_release-notes.htm)

# Release Notes

These release notes outline the changes introduced with the ERP/CRM Integrator 7.8.5 release.

This is primarily a release to fix some defects and to introduce some minor improvements. These include the extension of the supported Salesforce API version to include version 58, changes to the ABAP Function Modules, and expansion of some columns in the ERP/CRM Integrator repository to allow larger attribute sizes.

# Installation Considerations

## Installation

Run the Setup program to install. An existing ERP/CRM Integrator install will be upgraded.

Please make a backup of the SafyrSettings.xlsx file before installing, if you have made any changes to the previous ERP/CRM Integrator delivered version. Make sure to merge the changes you have made into the new version.

## Preparing the Source System for Extraction

Source system	Preparation
SAP	Install the latest SAP Transport if upgrading from 7.6 or earlier
SAP BW	Install the latest SAP Transport if upgrading from 7.6 or earlier
SAP BW on HANA	Install the latest SAP Transport if upgrading from 7.6 or earlier
Others	No change

**Important** The ABAP 'ALL' function modules, delivered as part of the ERP/CRM Integrator transports, now include additional checks to prevent Directory Traversal threats. This is only relevant when the ALL function is being used to write the data files to the SAP Server. Please see the section in Appendix A of the Getting Started Guide – Using the ABAP ALL Function Module for full details. ERP/CRM Integrator 7.8.5 will still work with the previous version of the ABAP Function modules, so there is no immediate requirement to install the new Transports.

## Re-extraction from Source System needed

Source system	Extraction
SAP	Not required unless upgrading from 7.6 or earlier.

Source system	Extraction
SAP BW	Some improvements to the representation of BW metadata require a re-extract, or a re-import of the .DAT files.
Salesforce	Version 58 of the Metadata API is now supported. Run an extract to get the latest metadata.
Others	No change.

## ERP/CRM Integrator Repository

All existing repositories will need to be updated. When first opening an existing repository, ERP/CRM Integrator will notify the user that an update to the structure is required. ERP/CRM Integrator will automatically update the database structure.

## Export Changes

None

## Automation Changes

None

# Release Details

## Improvements

- SIR-1897 – Updated ABAP Function Modules to prevent Directory Traversal threats.
- SIR-1962 – Salesforce API version 58 support.

## Defects

- SIR-1948 – Export to Collibra can fail due to duplicate relationship definitions.
- SIR-1963 – Salesforce extract fails due to Carriage Returns in Labels.
- SIR-1964 – Lineage between BW Open Hubs and MultiProviders is not showing.
